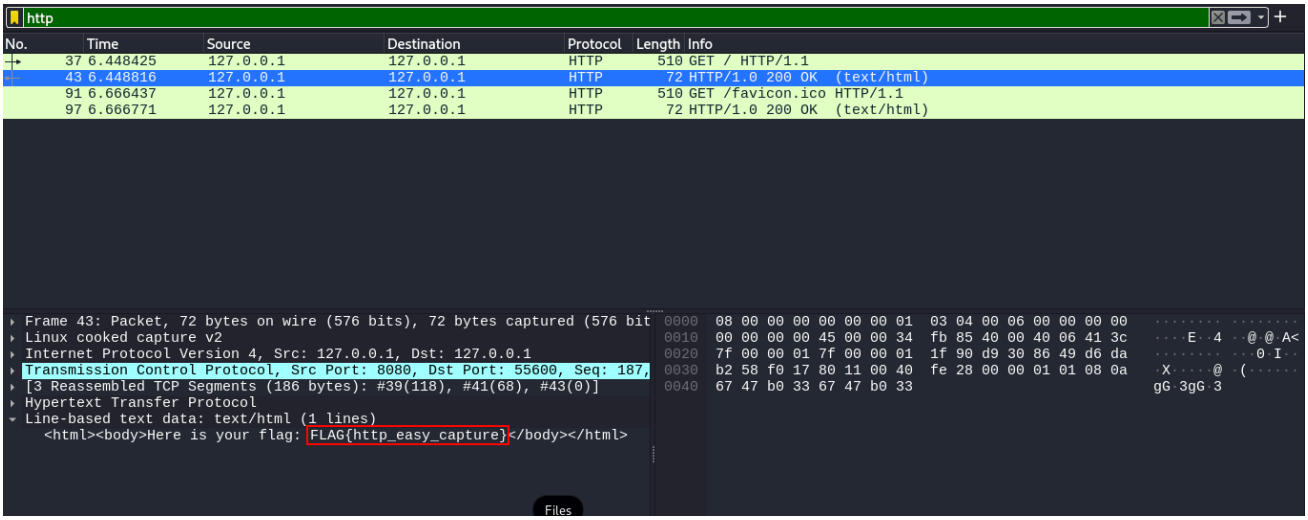
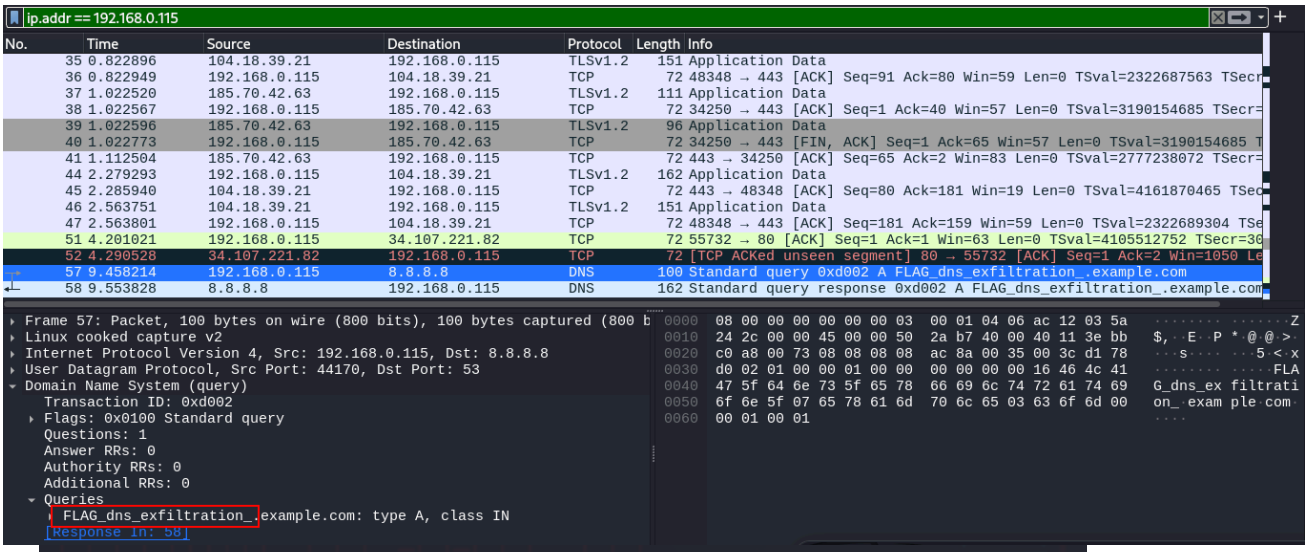
Analysis the picap file

- challenge 1 Hint: “Sometimes secrets travel unencrypted. Inspect the messages your browser asks for.”



or we can just use the strings command

- challenge 2 Hint: “Even small questions can carry hidden messages. Check what your system is asking the internet.”

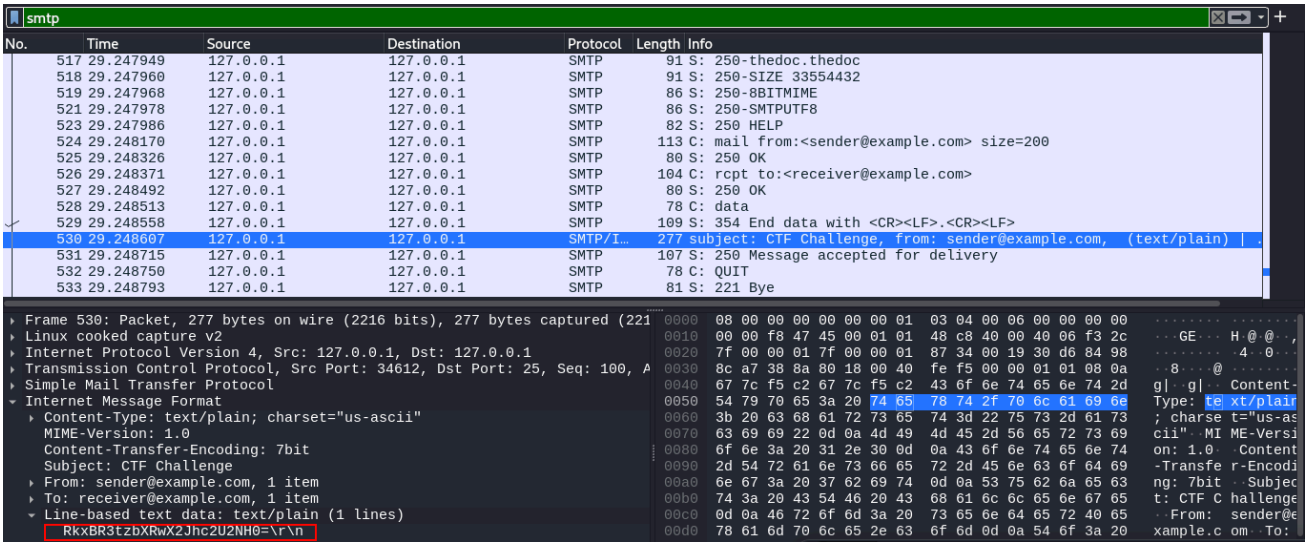


or

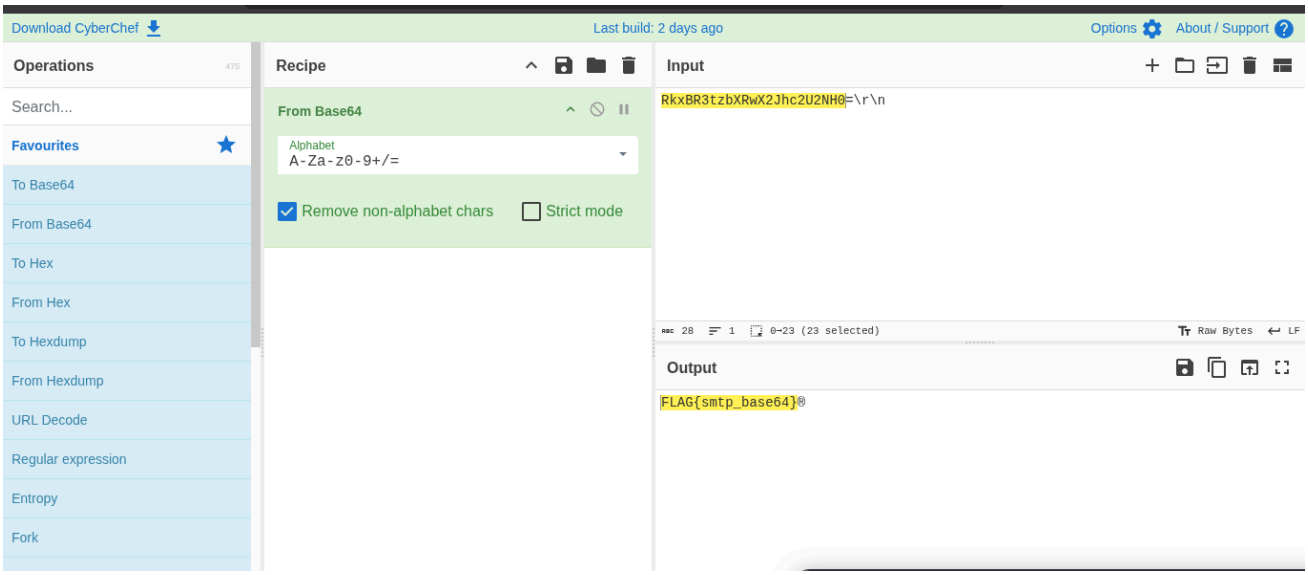
- challenge 3

We follow the tcp stream so we can get the full content

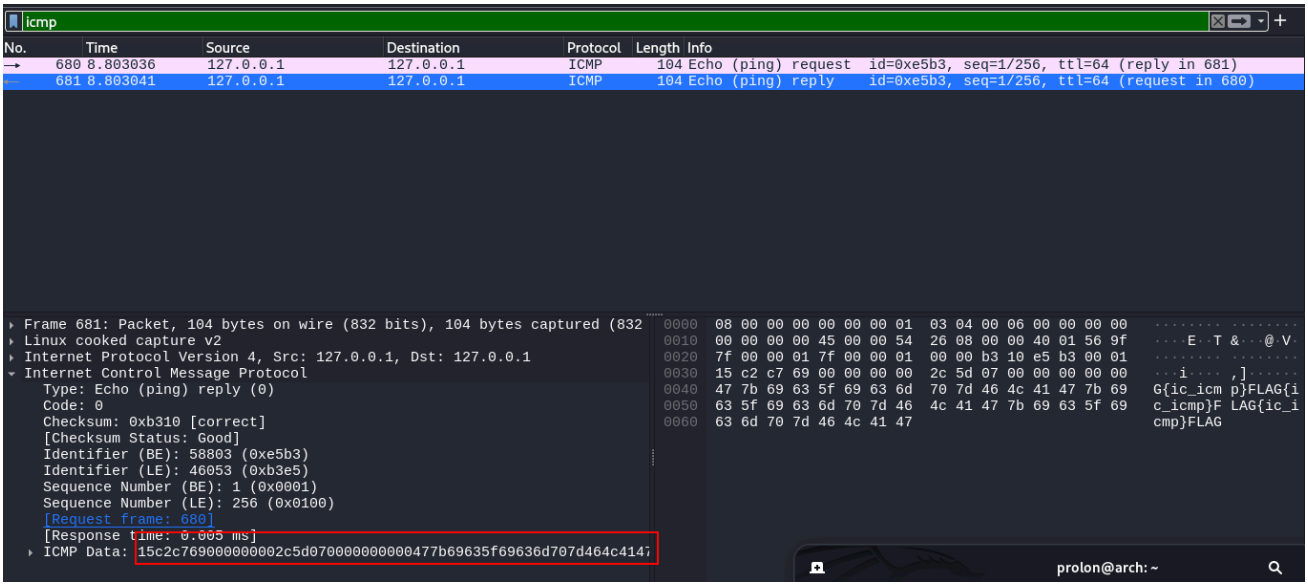
- challenge 4



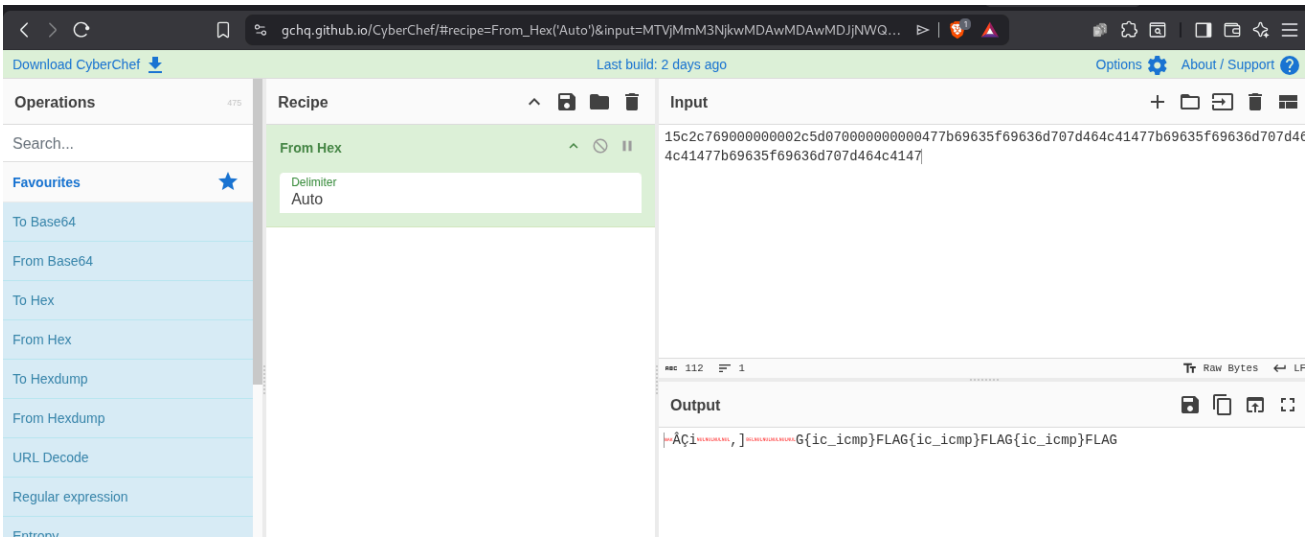
in this picap file the flag we look is encoded so we use the smtp protocol to get it so we have found the base64 now lets decode it



- challenge 5



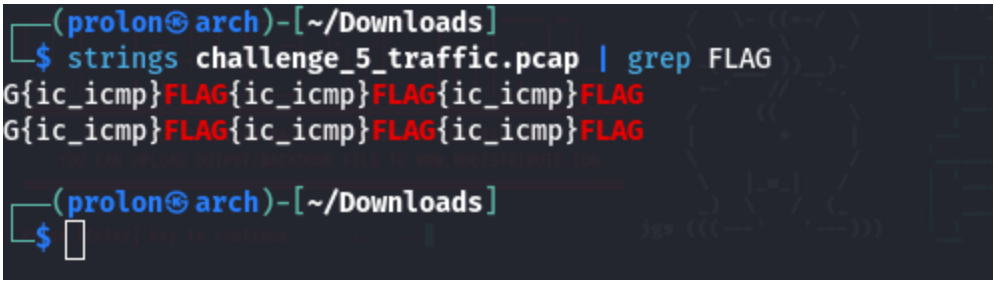
we have found the data so lets use the cybercafe tool to see what it is



or use terminal

```
 echo "RkxBR3tzbXRwX2Jhc2U2NH0=\r\n" | base64 -d
FLAG{smtp_base64}base64: invalid input
```

so we got our last flag or just use the strings command



```
1.FLAG{http_easy_capture}
2.FLAG_dns_exfiltration_
3.FLAG{tcp_stream_reassembly}
4.FLAG{smtp_base64}
5.FLAG{ic_icmp}
```
